DOCUMENTATION WEBSITE CONTROLS

we take any new gists. But changing the A, how do you deal with that? There's a technical problem, well not technical ...

III An administrator?

You can't just add another SSH-key to the server because it will be endless maintenance. But at the same time, how do you accept changes? And then, who decides what changes will be accepted?

For the founders we decided to have a maintainer for each font project.

It's the kind of thing we didn't do well. We have this kind of administrative way of managing the server. Well it's a lot of small elements that all together make it difficult. Let's say at some point we start to think maybe we need to manage our repositories, something a bit more sophisticated than Gitolite. So we consider something like GitHub. What would we do then we could imagine to rebuild a kind of ecosystem where people have their own repositories and do anything we can imagine on this kind of hosting service. Gitolite is a Free Software so you can deploy it on your own server. But it is not trivial to do.

III Can you explain the difference between Gitorious and GitHub?

Gitorious is first a free version, it's not a free version of Git but GitHub. One is free and one is not.

III Meaning you can't install GitHub on your own server.

Git is a storage back-end, and Gitorious or GitHub are a kind of web application to interact with the repository and to manage them. And GitHub is a product and a company depending other things. They offer a commercial service and a free service. They have a lot of success with the free service Git in a sense. And they make a lot of money at providing the same service, exactly the same, just that it means that you can have private space on the server. It's quite convenient, because the tools are really good to manage repositories. And Gitorious I don't know if it's a Free Software model, they make all their source code to run the platform Free Software. It means they're a bit less fancy features.
